

game slot w88

A signal is emitted when a particular event occurs. Qt's widgets have many pre-defined signals, but you can always subclass one to add your own. Essentially, a slot is a function that is called in response to a particular signal. Signals and slots are used to connect objects together. For example, a button has a signal called clicked() and a slot called clicked(). When the button is clicked, the clicked() signal is emitted and the clicked() slot is called. This is how Qt handles user input.
